Safety Instructions

The LS 400 is suitable for supplying laser diodes with a constant current and for supplying peltier elements with a constant voltage.

The device is not suitable for supplying loads which generate an electromotive force of more than 30 V.

The lines for the laser diodes must have a cross-section of 6 mm² use ring terminals.

Do not use a crimping tool which does not fit. This increases transition resistance and may cause a cable fire.

In any case of doubtful crimping additional soldering is required. Take care that the ring terminals are free of solder at the screws.

Use galvanized screws M5 x 8 and galvanized spring washers M5.

Take care of correct wiring of the laser diodes. Wrong polarity will damage the diodes.

Never disconnect the output lines for the laser diodes during operating.

This may generate a dangerous electric arc which can lead to skin burns or to fire.

Never connect the diode outputs to the TEC outputs.

The LS 400 is cooled by fans. Air is drawn in at the front panel and is blown out at the rear panel.

In an industrial environment with conductive dust air filtering is required.

Put the device out of operation if it has visible damages or if it doesn't work properly.

Description

The Laser systems LS 400 are complete systems for supplying laser diodes and TECs including a fan and a heatsink with milled mounting surface for mounting laser diodes or laser modules and TECs. The heatsink includes a printed circuit board with silver-coated connecting plates and female threads M5 for connecting the laser diodes and with solder pads for connecting TECs temperature sensor and pilot laser.

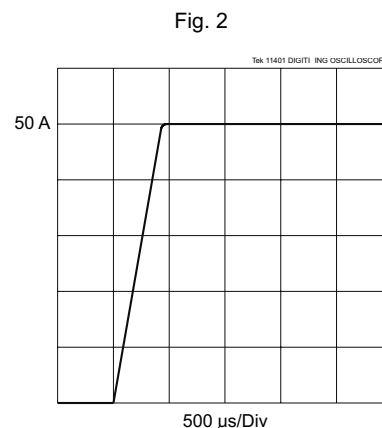

There are twentyfour different types of devices available simple systems for manually operating and more comple systems for manually and remote operating with currents up to 50 A for the LS 400-50 systems and currents up to 60 A for the LS 400-60 systems. Several types are also deliverable with an option for fast pulsing with fre uencies up to 5 kH .

All systems include the DT 400 a high-precision laser diode driver and a full bridge TEC driver with temperature controller and control logic uti ling Messtec s patented power switch technology. This technology has a lot of advantages and is particularly suited for driving laser diodes. It offers high accuracy and current stability a ecellent dynamic performance a high output impedance and low electromagnetic interference. No current overshoot or ringing arise when altering output current or load impedance abruptly.

Overshooting and ringing is very dangerous for laser diodes and it is the most dreaded thing in operating e pensive laser diodes.

Fig. 1 shows the step response of a conventional laser driver at a curent set point step of 0 ... 100 . There is e cessive overcurrent and ringing which may damage the laser diodes.

Fig. 2 shows the step response of the DT 400 at a current set point step of 0 ... 100 there is no overshoot or ringing the characteristic is nearly perfect.

Description

A further major property is the dynamic output impedance which has significant effects to the diode current if load impedance alters abruptly.

For example if there is a loose contact at the output lines and the output is open circuit the drivers output voltage will increase to its maximum value because of its characteristic to inject current. If the contact will be closed and you have a conventional laser driver with low dynamic output impedance excessive overcurrent will damage the laser diodes.

The same happens if you have stacked diodes and one of its emitters will getting short circuit. The load impedance will alter abruptly at this moment and excessive overcurrent will damage the complete stack.

Different from a conventional laser driver the DT 400 responds in this case absolutely reliable and no overcurrent occurs.

Fig. 3 shows the response of a conventional laser diode driver at a nominal output current of 50 A if load impedance is changed abruptly to lower values.

Fig. 4 shows the response of the DT 400 at the same conditions the diode current keeps constant.

Fig. 3

Fig. 4

General Instructions

Peltier element, cooling plate and heat sink

Do not operate a peltier element at its maximum limit or maximum cooling capacity the electrical power loss will be very high and the efficiency will be very bad.

Operate the peltier element at a voltage of half of the maximum allowed voltage.

Select a peltier element whose cooling capacity is sufficient at an operating voltage of half of the maximum allowed operating voltage.

Try to spread the heat dissipation of the laser diodes by an extensive cooling plate use extensive peltier elements or multiple peltier elements instead of a single one.

Temperature sensor

Use small temperature sensors with a low thermal mass the sensor must have a good thermal contact to the cooling plate. This is very important for the stability of the closed loop.

Use adhesives with high thermal conductivity for bonding the sensor. Do not use thick wires for connecting this will draw away thermal energy and will degrade performance.

A good solution is Messteck's 10360254 sensor using a KTY 11-5. It has two soldering pads for connecting and it is easy to handle.

The figure shows an application with the 10360254 sensor.

General Instructions**TEC voltage limit**

Adjust the TEC voltage limit before connecting a peltier element.

Connect a temperature sensor either Messtec s 10360254 KTY 11-5 a conventional KTY 11-5 or a PT 1000 at the printed circuit board of the heatsink.

Take care of the proper jumper setting at the DT 400.

You can also take a 1000 Ω resistor instead of a temperature sensor in this case set the jumper to PT 1000.

Connect a voltmeter at the TEC output of the printed circuit board and turn the system on.

Adjust TEC voltage to the maximum allowed value of your peltier element.

Temperature interlock

Do not adjust the trigger point very close to the operating temperature. Consider that in most cases a thermal overshoot will occur if the system is turned on.

Diode current and diode current limit

Do not connect laser diodes if it is the first time you put a system into operation.

Use a short circuit instead of laser diodes connect the +laser diode output to the -laser diode output.

All settings adjustments and tests can be done with the short circuit.

System LS 400-50 (10100050) and LS 400-60 (10100080)

Manually operated systems with diode currents up to 50 A for LS 400-50 and diode currents up to 60 A for LS 400-60.

Front panel

Key-operated switch and emergency stop button for the mains voltage.

Current set point potentiometer two buttons for Laser On and Laser Off a digital display for the current set point and six LEDs for indicating states.

Rear panel

Connector for the mains voltage BNC jack for analog current modulation BNC jack for TTL pulse modulation signal or TTL shut down and a dummy plate for the fibre output.

Block diagram System LS 400-50 (10100050) and LS 400-60 (10100080)

System LS 400-50 (10100050) and LS 400-60 (10100080)**Adjustments**

Diode current set point

Potentiometer at the control panel the range can be adjusted by two potentiometers at the front panel e.g. from 35.6 A to 45.5 A.

Diode current limit

Diode current limit potentiometer at the DT 400. Factory setting ma imum.

TEC voltage limit

TEC voltage limit potentiometer at the DT 400. Factory setting ma imum.

Temperature set point

Temperature set point potentiometer at the DT 400. Factory setting undefined.

Temperature interlock

Temperature interlock potentiometer at the DT 400. Factory setting ma imum.

Reference voltage

Reference voltage potentiometer at the DT 400. Factory setting ma imum 5.000 V do not turn out of position.

Jumper settings at the DT 400

Operating mode

On/Off

Shut Down

Active High or Active Low. Factory setting active High.

Diode current limit

Turn the current set point potentiometer at the control panel clockwise to its ma imum display reading must be 50.0 A or 60.0 A.

Adjust the current limit potentiometer at the DT 400 to the desired value display reading .

Current set point range

Turn current set point potentiometer clockwise to its ma imum turn the right readout potentiometer to the desired value e.g. 45.5 A display reading .

Turn current set point potentiometer counterclockwise to its minimum turn the left readout potentiometer to the desired value e.g. 20.0 A display reading .

Operating manual

System LS 400-50 (10100052) and LS 400-60 (10100082)

Manually operated and remote-controlled systems with diode currents up to 50 A for LS 400-50 and diode currents up to 60 A for LS 400-60.

The system can be fully configured and controlled via the RS 232 port and fully controlled via the control port.

Signal levels at the control port meet the common industry standard for directly connecting a programmable controller PLC or any other controller.

The option of system configuring via the RS 232 port and set-up software requires a PC with Windows™ operating system makes the system exceptionally flexible. For example it is possible to define in both operating modes local or remote where the current set point shall come from from internal nonvolatile memory from control port or from control panel.

Front panel

Key-operated switch and emergency stop button for the mains voltage current set point potentiometer two buttons for Laser On and Laser Off a digital display for the current set point and seven LEDs for indicating current states.

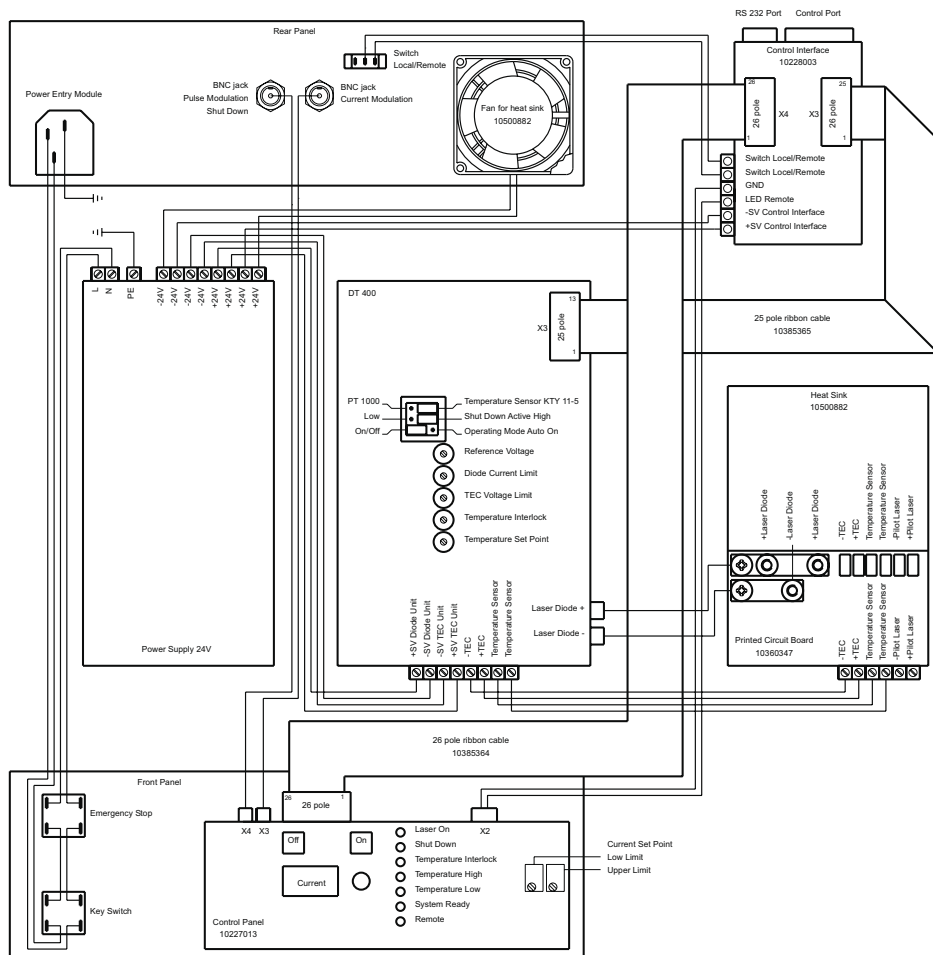

Rear panel

Connector for the mains voltage BNC jack for analog current modulation BNC jack for TTL pulse modulation signal or TTL shut down switch Local/Remote 9 pole female plug connector of RS 232 port and 25 pole female plug connector of control port.

A safety interlock is required e.g. if a laser operates in a machine where parts will be inserted or removed manually. In this case laser radiation has to be interrupted immediately and the system must be kept in a safe off-state.

A safe off-state may be achieved by a safety beam shutter but in most cases there is less space in the optical path.

A better and cost saving way is to switch off the laser power supply and keep it in a safe off-state. Safe off-state means that the laser power supply must be electrically disconnected switching off by a digital signal like a shut down or a disable signal is forbidden for a safe operating.

It is regulation that disconnection must be happen by a relay or a switch the use of semiconductors or electronic switches for disconnecting is not allowed. The proper function of the relay must be supervised in a manner that malfunction does not lead to an unsafe state.

The safety interlock of the LS 400 complies with regulation and has a lot of additional features for achieving a safe off-state within a very short time.

There are two relays connected in series a working relay and an emergency relay. The emergency relay is always closed the working relay acts if an interlock occurs. The normally open contact and the normally closed contact of both relays are supervised.

If the working relays does not work properly or if there is a failure in the interlock unit the emergency relays will be de-energized and turns the system in a steady off-state.

Every time the mains voltage is turned on the function of the emergency relays is checked to ensure correct operation. If there is a failure the system cannot be turned on.

Both relays are working currentless for achieving maximum life time.

If an interlock occurs the output for the laser diodes will be short circuited immediately by a semiconductor to ensure that laser radiation will be stopped within a few microseconds.

Simultaneously the laser power supply will be turned off and the working relay will be de-energized. At the same time the input capacitors of the laser power supply will be discharged to ensure that no stored energy will cause laser radiation if there is any malfunction.

Also the semiconductor and the circuit for discharging are supervised.

Additionally the interlock unit has an output for a beam shutter. The output is also supervised.

It is regulation that every time an interlock has occurred the operator has to confirm system safety by a keystroke to the validation button before continuing operation.

The validation button can be disabled by a jumper this simplifies operating because the button must not be pressed every time an interlock occurs. Check country-specific regulations before disabling the validation button.

Ask our support how to disable the validation button.

Interlock input

2 pole female socket manufacturer Binder 99 0604 00 02.

| | | |
|-------------------|--------------|----------------|
| Interlock voltage | 12 V | Contact open |
| Interlock current | approx. 1 mA | Contact closed |

An interlock occurs if the contact is open.

Systems LS 400-50 (10100054), LS 400-60 (10100084), LS 400-50 FP (10100064) and LS 400-60 FP (10100074)

Shutter output

4 pole female socket manufacturer Binder 99 0612 00 04.

If an interlock occurs the shutter output voltage is turned off.

The shutter output voltage is 12 V/0.5 A ma or 24 V/0.5 A ma selectable by a jumper.

Factory setting 12 V.

The jumper is beneath connector X5 of the interlock unit it is difficult to access dismounting of the heatsink is required.

Adjustments

Diode current set point

Potentiometer at the control panel the range can be adjusted by two potentiometers at the front panel e.g. from 35.6 A to 45.5 A.

Diode current limit

Diode current limit potentiometer at the DT 400. Factory setting ma imum.

TEC voltage limit

TEC voltage limit potentiometer at the DT 400. Factory setting ma imum.

Temperature set point

Temperature set point potentiometer at the DT 400. Factory setting undefined.

Temperature interlock

Temperature interlock potentiometer at the DT 400. Factory setting ma imum.

Reference voltage

Reference voltage potentiometer at the DT 400. Factory setting ma imum 5.000 V do not turn out of position.

A safety interlock is required e.g. if a laser operates in a machine where parts will be inserted or removed manually. In this case laser radiation has to be interrupted immediately and the system must be kept in a safe off-state.

A safe off-state may be achieved by a safety beam shutter but in most cases there is less space in the optical path.

A better and cost saving way is to switch off the laser power supply and keep it in a safe off-state. Safe off-state means that the laser power supply must be electrically disconnected switching off by a digital signal like a shut down or a disable signal is forbidden for a safe operating.

It is regulation that disconnection must be happen by a relay or a switch the use of semiconductors or electronic switches for disconnecting is not allowed. The proper function of the relay must be supervised in a manner that malfunction does not lead to an unsafe state.

The safety interlock of the LS 400 complies with regulation and has a lot of additional features for achieving a safe off-state within a very short time.

There are two relays connected in series a working relay and an emergency relay. The emergency relay is always closed the working relay acts if an interlock occurs. The normally open contact and the normally closed contact of both relays are supervised.

If the working relays does not work properly or if there is a failure in the interlock unit the emergency relays will be de-energized and turns the system in a steady off-state.

Every time the mains voltage is turned on the function of the emergency relays is checked to ensure correct operation. If there is a failure the system cannot be turned on.

Set up and control software

Operating manual

Systems LS 400-50 FP (10100067) and LS 400-60 FP (10100077)

This systems are the same like the LS 400-50 and the LS 400-60 the difference is that FP systems can be pulsed faster.

Rise time is approx. 500 ns and fall time is approx. 7 s maximum allowed pulse frequency is 5 kHz .

Control port and RS 232 port

Systems LS 400-50 10100052 10100053 10100056 10100057
Systems LS 400-60 10100082 10100083 10100086 10100087
Systems LS 400-50 FP 10100066 10100067
Systems LS 400-60 FP 10100076 10100077

The control port and the RS 232 port are microprocessor controlled. Signal levels at the control port meet the common industry standard such as analog levels of 0 ... 10 V for inputs and outputs and digital levels up to 30 V for directly connecting a programmable controller PLC or any other controller.

The systems can be fully controlled via the control port and fully configured and controlled via the RS 232 port.

The option of system configuring via the RS 232 port and set-up software requires a PC with Windows™ operating system makes the system exceptionally flexible.

It is possible to define in both operating modes local or remote where the current set point and the temperature set point shall come from from internal nonvolatile memory from control port or from a control panel and it is possible to define where the current limit shall come from from internal nonvolatile memory or from control port.

Example 1

You can configure a remote controlled system in such a way that it is controlled by a PLC at the control port but nevertheless the current set point can be adjusted manually at the control panel. The current limit value and the temperature set point is given via the control port or by the internal nonvolatile memory.

This allows remote operating with the possibility of manually correcting manufacturing results.

Example 2

You can configure a local controlled system in such a way that it is manually controlled by the buttons at the control panel but the current set point or the temperature set point cannot be adjusted manually. These values are given by the internal nonvolatile memory.

Refer to section set up and remote control in this manual for detailed information.

Control Port

Control Port

Signal Description

CA-DCSP

Control Analog - Diode Current Set Point

Analog input 0 ... +10.000 V for the current set point.

+10.000 V corresponds to the maximum output current of the system 50 A or 60 A .

CA-DCL

Control Analog - Diode Current Limit

Analog input 0 ... +10.000 V for the diode current limit.

+10.000 V corresponds to the maximum output current of the system.

The diode current limit value is defined either by the value of the CA-DCL signal the value of the nonvolatile memory setup software the value of the RS 232 software or by the setting of the diode current limit potentiometer at the DT 400.

Turn current limit potentiometer at the DT 400 clockwise to its maximum value if you would like to define the current limit value by the CA-DCL signal by memory or by RS 232.

CA-PTSP

Control Analog - Peltier Temperature Set Point

Analog input 0 ... +10.000 V for a peltier temperature of 0 ... +50 C.

The peltier temperature set point is defined either by the value of the CA-PTSP signal the value of the nonvolatile memory setup software the value of the RS 232 software or by the setting of the temperature set point potentiometer at the DT 400.

Turn temperature set point potentiometer at the DT 400 counterclockwise to its minimum value if you would like to define the temperature set point by the CA-DCL signal by memory or by RS 232.

CD-DCON

Control Digital - Diode Current On

Digital input active high. High turns diode current on low turns off.

CD-DCSD

Control Digital - Diode Current Shut Down

Digital input active high or active low depends on configuration by setup software.

Disables diode current.

CD-PSD

Control Digital - Peltier Voltage Shut Down

Digital input active high. High turns the peltier voltage off.

SA-DCACT

Status Analog - Diode Current Actual

Analog output 0 ... +10.000 V reflects the actual diode current.

SA-DCSPLIM

Status Analog - Diode Current Set Point Limited

Analog output 0 ... +10.000 V reflects the actual diode current set point limited by the diode current limit value. The diode current limit value may be the CA-DCL signal the value of the nonvolatile memory setup software or the setting of the diode current limit potentiometer at the DT 400.

Control Port

Control Port

**SA-DVACT**

Status Analog - Diode Voltage Actual

Analog output 0 ... +10.000 V reflects the actual diode voltage.

+10.000 V corresponds to a diode voltage of +25.000 V.

SA-DPEACT

Status Analog - Diode Power Electrically Actual

Analog output 0 ... +10.000 V reflects the actual electrically diode power.

+10.000 V corresponds to a diode power of 500 .

SA-PTACT

Status Analog - Peltier Temperature Actual

Analog output 0 ... +10.000 V reflects the actual peltier temperature.

0 ...+10.000 V corresponds to a peltier temperature of 0 ... +50 C.

REFAnalog output +5.000 V ± 0.1 output impedance is 100 Ω .**AUX+5V**

Auxiliary voltage +5.1 V maximum allowed current is 200 mA.

AUX+15V

Auxiliary voltage approx. +15 V maximum allowed current is 100 mA.

AUX-15V

Auxiliary voltage approx. -15 V maximum allowed current is 100 mA.

SD-READY

Status Digital - Ready

Digital output open collector active low. Low if there are no errors and if the system is ready.

SD-DCON

Status Digital - Diode Current On

Digital output open collector active low. Low if the diode current is turned on.

SD-DCSD

Status Digital - Diode Current Shut Down

Digital output open collector active low. Low if the diode current shut down is active.

SD-PTL

Status Digital - Peltier Temperature Low

Digital output open collector active low. Low if the peltier temperature is too low.

SD-PTH

Status Digital - Peltier Temperature High

Digital output open collector active low. Low if the peltier temperature is too high.

Control Port

Control Port

**SD-PTI**

Status Digital - Peltier Temperature Interlock

Digital output - open collector - active low. Low if there is a peltier temperature interlock.

A peltier temperature interlock means that the peltier temperature has exceeded the temperature supervision value due to excessive temperature.

The temperature supervision value is defined either by the value of the nonvolatile memory setup software or by the setting of the temperature interlock potentiometer at the DT 400.

Turn temperature interlock potentiometer at the DT 400 clockwise to its maximum value if you would like to define the supervision value by the setup software.

SD-SIL

Status Digital - Safety Interlock

Digital output - open collector - active low. Low if an interlock occurred.

SD-REM

Status Digital - Remote

Digital output - open collector - active low. Low if the system works in the remote operating mode.

Digital signal levels

All digital inputs can be operated by TTL CMOS or any other logic levels up to +30 V.

All digital outputs can drive up to 20 mA the maximum permitted voltage is +30 V.

RS 232 Port

9 pole female plug connector according to DIN 41652 and MIL-C-24308 female thread UNC 4-40.

The serial interface meets the requirement of the RS 232C standard.

It is configured as a data terminal equipment (DTE).

The port sends data at pin 2 (TX) and receives data at pin 3 (RX) signal ground is at pin 5.

A hardware handshake is not used. The RTS/CTS signal can be looped through by a jumper or a fixed state 0 or 1 can be assigned to RTS.

The logic states correspond to the CCITT recommendation V.28.

Permitted baud rates are 1200 2400 4800 9600 19200 38400 57600 and 115200.

The data format is 8 data bits no parity one stop bit.

No software hand shake (XON/XOFF) is used.

The interface is full duplex capable.

The interface can interact directly with a PC via a 9 pole cable it receives control data and sends status data and measurements of the complete system.

Status data and measurements will be permanently sent independently of the operating mode manually operated operated by control port operated by RS 232 port.

The option of system configuring and saving configuring data in the nonvolatile memory of the control interface makes the system exceptionally flexible.

For example it is possible to define in both operating modes local or remote where the current set point shall come from from internal memory from control port or from control panel.

System configuring and controlling may be done by customer software or by the LS 400 system software which is included in delivery.

This software is very comfortable and easy to handle. It allows system configuring system controlling and system monitoring.

Customer-specific modification of the LS 400 software is possible for instance putting your logos at the screen or suchlike.

Ask our support for customer-specific software.

Laser Systems LS 400

System software Set Up

RS 232 Port

Install the system software and connect a PC at the RS 232 port.

Turn on your system start the program and select Set Up for configuring your system.

Enter the required values at the Set Up panel these values will be stored in the nonvolatile memory of the system and will be relevant if memory is selected as a data source in the local or remote mode.

The Diode Voltage Limit value does not really affect the output voltage of the system it is a supervision value which leads to a warning if exceeded. This is useful for detecting bad laser diodes or bad contacts at the output lines.

For the TEC Temperature Interlock and the TEC Interlock Time Out do not select low values.

Consider that in most cases a thermal overshoot will occur if the system is turned on.

Select whether the TEC Interlock Control shall be active or not. If you select active the system will be turned off after the TEC interlock time if there is excessive TEC temperature.

Select Shut Down Signal Polarity Low or High. If you select High the diode current will be shut down if the shut down signal is High.

Press the Confirm button the values will be stored in the memory of the system.

The screenshot shows the 'Laser System LS 400-50 - Set Up' window. It features a menu bar (File, Com, Features, ?) and a title bar. The main area is divided into several sections:

- LS 400-50**: Serial Number: 00000, Control Status: []
- Start Window**: A tabbed interface with 'Monitor' and 'Set Up' selected.
- Stored Values**: A table of parameters and their ranges:

| | |
|------------------------------|-----------------------|
| Diode Current Limit | 0,00...50,00 A |
| Diode Current Set Point | 0,00...50,00 A |
| Diode Voltage Limit | 0,00...25,00 V |
| TEC Temperature Interlock | 0,00...50,00 °C |
| TEC Temperature Set Point | 0,00...50,00 °C |
| TEC Interlock Time Out | 0,0...655,3 s |
| TEC Interlock Control active | <input type="radio"/> |
- Set Up Panel**: A table for configuring parameters:

| | | |
|------------------------------|------------------------------------|-----------------|
| Diode Current Limit | <input type="text" value="0,000"/> | 0,00...50,00 A |
| Diode Current Set Point | <input type="text" value="0,000"/> | 0,00...50,00 A |
| Diode Voltage Limit | <input type="text" value="0,000"/> | 0,00...25,00 V |
| TEC Temperature Interlock | <input type="text" value="0,000"/> | 0,00...50,00 °C |
| TEC Temperature Set Point | <input type="text" value="0,000"/> | 0,00...50,00 °C |
| TEC Interlock Time Out | <input type="text" value="0,0"/> | 0,0...655,3 s |
| TEC Interlock Control active | <input type="checkbox"/> | |
- Shut Down Signal Polarity**: Low High
- LOCAL** and **REMOTE** sections: Each contains three columns (Current Set Point, Diode Current Limit, Temp. Set Point) with radio buttons for Memory, Control Port, and Control Panel, and a checkbox for 'Enable Shut Down Control Port'.
- Communication**: No communication, Receive Baudrate (indicated by a blue dot).
- Status Panel**: A row of indicator lights for Safety IL, Remote, System Ready, TEC Temperature Low, TEC Temperature High, Interlock (IL), Shut Down, and Laser On.
- Buttons**: 'Confirm' and 'Exit'.

Laser Systems LS 400

System software Set Up

RS 232 Port

Fill out the LOCAL form at the left side for the data sources in the local operating mode.

Select the data source for current set point diode current limit and temperature set point.
Select whether a shut down signal at the control port shall be effective or not.

Fill out the REMOTE form at the right side for the data sources in the remote operating mode.

Select the data source for current set point diode current limit and temperature set point.
Select whether a shut down signal at the control port shall be effective or not.

Press the Confirm button the settings will be stored in the memory of the control interface.

System software Set Up**Example for a Set Up**

You plan a laser system which shall be operated manually and remote controlled.

For the remote operating mode there is a programmable logic controller PLC at the control port which does not have analog outputs. Your laser has one diode the diode current shall be 45 00 A diode current limit shall be 46 50 A and temperature set point shall be 24 30 C.

In the local operating mode the current set point and the temperature set point shall be adjusted manually for experimentation a High shut down signal from the PLC shall be effective and shall turn off the diode current.

Turn on your system start the program and select Set Up for configuring your system.

At the Set Up panel enter 46 50 A for the diode current limit

enter 45 00 A for the diode current

enter 2 50 V for the diode voltage limit.

Enter 30 00 C for the TEC temperature interlock

enter 24 30 C for the temperature set point

enter 10 0 s for the TEC interlock time out.

Select TEC interlock control active.

Select Shut Down Signal Polarity High at the left side.

Fill out the LOCAL form at the left side for the data sources in the local operating mode.

Select Control Panel for the current set point

select Memory for the diode current limit

select Control Panel for the temperature set point.

Select Enable Shut Down Control Port.

Fill out the REMOTE form at the right side for the data sources in the remote operating mode.

Select Memory for the current set point

select Memory for the diode current limit

select Memory for the temperature set point.

Select Enable Shut Down Control Port.

Press the Confirm button the settings will be stored in the memory and the system is ready for operating.

Laser Systems LS 400

System software Set Up

Example for a Set Up

RS 232 Port

The screenshot shows the 'Laser System LS 400-50 - Set Up' window. It features a menu bar with 'File', 'Com', and 'Features'. The main area is divided into several sections:

System software RS 232 Control

RS 232 Port

Select RS 232 Control for controlling the system by your PC.
 Enter the required values for diode current limit diode current set point and TEC temperature set point at the RS 232 Control Panel.
 Select the data source for diode current limit diode current set point and TEC temperature set point. Select whether a shut down signal at the control port shall be effective or not.
 If you select RS 232 for diode current limit diode current set point and TEC temperature set point the registered values at the RS 232 Control Panel will be relevant at operating.
 In other cases this values will be ignored.
 If you select Memory as a data source the value registered in the memory set up will be relevant at operating.
 If you select Control Panel as a data source the setting of the potentiometer at the control panel will be relevant at operating.
 If you select Control Port as a data source the analog set point signal fed in at the control port will be relevant at operating e.g. the diode current set point signal CA-DCSP.
 Every time you alter a value or a setting you have to press the Confirm button.

There are three buttons for operating button ON button OFF and TEC Shut Down.
 Button ON turns the laser on button OFF turns the laser off.
 The button TEC Shut Down turns the TEC voltage off this is useful for equipment testing.

The screenshot displays the 'Laser System LS 400-50 - RS232-Control' software interface. The main window is titled 'LS 400-50' and shows 'Serial Number: 0000' and 'Control Status'. The interface is divided into several sections:

- Start Window:** Contains four vertical sliders for 'Diode Current Actual', 'Diode Voltage Actual', 'Diode Electrical Power', and 'Peltier Temperature Actual', each with a 'Set Point Limited' value (50 A, 25 V, 500 W, and 50 °C respectively).
- Monitor:** Displays 'Diode Current Actual' and 'Peltier Temperature Actual' with their respective values.
- RS232 Control:** The active control panel. It includes:
 - Diode Current Limit: 48,00 (range 0,00...50,00 A)
 - Diode Current Set Point: 50,00 (range 0,00...50,00 A)
 - TEC Temperature Set Point: 16,00 (range 0,00...50,00 °C)
 - Buttons: Confirm, ON (highlighted in green), TEC Shut Down.
 - Diode Current Limit data source: RS232 (selected), Memory, Control Port.
 - TEC Temperature Set Point data source: RS232 (selected), Memory, Control Panel.
 - Enable Shut Down: Control Port (checked).
- Set Up:** Contains 'TEC Control On' (radio button), 'Time Out' (327.6), 'RS232 Control On' (radio button), 'Time Out', and 'Send Interval'.
- Status Panel:** Located at the bottom, it shows indicators for 'Safety IL', 'Remote', 'System Ready', 'TEC Temperature Low', 'TEC Temperature High', 'Shut Down', and 'Laser On'. A 'Receive Baudrate' indicator is also present.

**RS 232 Port
Software Protocol**

Status Data

Status data are splitted in three packets.

Packet P1 informs about measured values current operating states and working hours.

Packet P2 informs about data from control port and control panel.

Packet P3 informs about stored data.

The short name of the data contains a data source number according to its origin.

| Data source | data source number |
|-------------------|--------------------|
| DT 400 | 1 |
| Control Port | 2 |
| Control Panel | 3 |
| Memory | 4 |
| RS232 Port | 5 |
| Control Interface | 6 |

Control Byte SD6CON

Status Digital 6 Control

Packet P1 Packet P2 and Packet P3 respectively Byte 3.

Reflects the current state of the control byte CD6CON.

Contains the following status bits

Reset Diode Working Hours SB6RDWH

Status Bit 6 Reset Diode orking Hours

Byte 3 Bit 1

Reflects that the counter for the operating hours will be resetted. Reset will be done by control bit CB5RD H with data source number 5.

Power Supply On SB6PSON

Status Bit 6 Power Supply On

Byte 3 Bit 2

Reflects that the system is in an on-state. On will be done by control bit CB5PSON of the RS 232 port and /or by a CD-DCON signal at the control port or in the manual mode by a ON keystroke at the control panel.

TEC Shut Down SB6TSD

Status Bit 6 TEC Shut Down

Byte 3 Bit 4

Reflects that the TEC output is shut down. A TEC shut down will be done by control bit CB5TSD of RS 232 port or by a CD-PSD signal at the control port.

Reboot Firmware SB6REBOOT

Status Bit 6 Reboot

Byte 3 Bit 5

Reflects that a restart of the control interface was activated. A restart will be done by

**RS 232 Port
Software Protocol**

control bit CB5REBOOT of the RS 232 port.
A restart is required if the system will be new configured.

Data Store SB6STORE

Status Bit 6 Store

Byte 3 Bit 6

Reflects that the data will be saved. Control bit CB5STORE must be set in the configuration data set for saving data.

CD-DCON signal at the control port SB6CPPSON

Status Bit 6 Control Port Power Supply On

Byte 3 Bit 7

Reflects that the CD-DCON signal at the control port is High for turning on the system.

Operating mode SD6OM

Status Digital 6 Operating Mode

Packet P1 Packet P2 und Packet P3 respectively Byte 4.

Reflects the current state of control.

Operating Mode RS 232 SB6OMRS

Status Bit 6 Operating Mode RS 232

Byte 4 Bit 1

Reflects that the system is controlled by RS232.

Remote Mode Active SB6REM

Status Bit 6 Remote Mode

Byte 4 Bit 2

Reflects that the remote mode is active.

TEC Shut Down Active SB6TSDA

Status Bit 6 TEC Shut Down Active

Byte 4 Bit 4

Reflects that the TEC shut down is active.

Receive RS 232 SB6RRS

Status Bit 6 Receive RS 232

Byte 4 Bit 6

Reflects that the system has received a byte from the RS 232 port.

Data Source Decoder SD6DEC

Status Digital 6 Data Source Decoder

Packet P1 Packet P2 und Packet P3 respectively Byte 5.

Reflects the current assignments of the data sources.

**RS 232 Port
Software Protocol**

Data Source Decoder Local Mode SD4DECLOC

Status Digital 4 Data Source Decoder Local

Packet P3 Byte 23

Reflects the settings of the decoder which were configured with configuration byte CF5DECLOC and were stored.

The settings of the decoder will be loaded from memory during local mode starting procedure.

Data Source Decoder Remote Mode SD4DECREM

Status Digital 4 Data Source Decoder Remote

Packet P2 Byte 23

Reflects the settings of the decoder which were configured with configuration byte CF5DECREM and were stored.

The settings of the decoder will be loaded from memory during remote mode starting procedure.

In Out Control SD6IOC

Status Digital 6 In Out Control

Packet P1 Packet P2 und Packet P3 respectively Byte 6.

Reflects the settings of bits and contains the code of status data sets transmit and control data sets receive. The code is mandatorily required.

Control Port Shut Down Enable SB6CPSDE

Status Bit 6 Control Port Shut Down Enable

Byte 6 Bit 0

Reflects whether the shut down signal CD-DCSD at the control port is effective or not.

Shut Down Polarity Positive SB6SDPOLP

Status Bit 6 Shut Down Polarity Positive

Byte 6 Bit 2

Reflects whether a High shut down signal or a Low shut down signal results in a shut down.

If bit 2 is 0 a Low signal results in a shut down if bit 2 is 1 a High signal results in a shut down.

This bit is effective in all control modes.

Temperature Control On SB6TCON

Status Bit 6 Temperature Control On

Byte 6 Bit 3

Reflects whether a temperature interlock is effective or not. If temperature interlock is active and an excessive temperature occurs the diode current will be turned off and error bit EB6TF will be set. This bit is effective in all control modes.

Code of received data sets

| Byte 6 | Bit 5 | Bit 4 | Data set name |
|--------|-------|-------|------------------------|
| | 0 | 0 | Control data set |
| | 0 | 1 | Configuration data set |
| | 1 | 0 | Unused |
| | 1 | 1 | Short control data set |

**RS 232 Port
Software Protocol**

Code of transmitted data sets

| Byte 6 | Bit 7 | Bit 6 | Data set name |
|--------|-------|-------|--------------------------|
| | 0 | 0 | Status data set packet 1 |
| | 0 | 1 | Status data set packet 2 |
| | 1 | 0 | Status data set packet 3 |
| | 1 | 1 | Unused |

In Out Control Local SD4IOCLOC

Status Digital 4 In Out Control Local
Packet P3 Byte 24.

Reflects whether the shut down signal CD-DCSD at the control port is effective in the local mode or not. The setting is stored in SD4CPSDEL. The other bits aren't significant.

In Out Control Remote Mode SD4IOCREM

Status Digital 4 In Out Control Remote
Packet P2 Byte 24.

Reflects whether the shut down signal CD-DCSD at the control port is effective in the remote mode or not. The setting is stored in bit SD4CPSDER. The other bits aren't significant.

Error bits

Packet P1 in byte 8 and in byte 10 respectively in the upper half byte.

Temperature Limit EB6TL

Error Bit 6 Temperature Limit
Packet P1 Byte 8 Bit 4

Bit 4 will be set if the TEC temperature interlock value will be exceeded. The diode current will be turned off.

RS 232 Data Fail EB6DFAIL

Error Bit 6 Data Fail
Packet P1 Byte 8 Bit 5

Bit 5 will be set if there is a data transfer error at the RS 232 port.

RS 232 Time Out EB6TOUT

Error Bit 6 Time Out
Packet P1 Byte 8 Bit 6

Bit 6 will be set if the RS 232 port doesn't receive data within the Time Out time. The diode current will be switched off. Bit 6 will be resetted if data will be received again however the diode current remains in an off-state.

RS232 Wrong Sign EB6WS

Error Bit 6 Wrong Sign
Packet P1 Byte 8 Bit 7

Bit 7 will be set if a wrong character will be received. Bit 7 will be resetted if valid characters will be received again.

**RS 232 Port
Software Protocol****Hardware Fault EB6HFAIL**

Error Bit 6 Hardware Fault
Packet P1 Byte 10 Bit 4
Bit 4 will be set if there is a hardware fault.

Voltage Limit EB6VL

Error Bit 6 Voltage Limit
Packet P1 Byte 10 Bit 6
Bit 6 will be set if the diode voltage exceeds the diode voltage supervision value.
Bit 6 will be reset if the diode voltage is lower than the diode voltage supervision value.

Decoder Fail EB6DECF

Error Bit 6 Data Source Decoder Fail
Packet P1 Byte 10 Bit 7
Bit 7 will be set if the data source decoder gets an invalid value. In this case the diode current cannot be turned on.

Operating mode bits

Packet P1 in byte 8 and in byte 10 respectively in the upper half byte.

TEC Temperature Low SB6PTL

Status Bit 6 Peltier Temperature Low
Packet P1 Byte 12 Bit 4
Bit 4 will be set if the current TEC temperature is lower than the temperature set point.

TEC Temperature High SB6PTH

Status Bit 6 Peltier Temperature High
Packet P1 Byte 12 Bit 5
Bit 5 will be set if the current TEC temperature is higher than the temperature set point.

Shut Down Active SB6SDA

Status Bit 6 Shut Down Active
Packet P1 Byte 12 Bit 6
Bit 6 will be set if a shut down is active.

Power Supply On SB6PSONA

Status Bit 6 Power Supply On
Packet P1 Byte 12 Bit 7
Bit 7 will be set if the system is turned on.

Power Supply Ready SB6PSR

Status Bit 6 Power Supply Ready
Packet P1 Byte 14 Bit 4
Bit 4 will be set if the system is ready for operating.

**RS 232 Port
Software Protocol**

Interlock Active SB6ILA

Status Bit 6 Interlock Active
Packet P1 Byte 14 Bit 5
Bit 5 will be set if the safety interlock is active.

Local Mode SB6LOCAL

Status Bit 6 Local Mode
Packet P1 Byte 14 Bit 6
Bit 6 will be set if the system operates in the local mode.

Temperature Interlock Active SB6TILA

Status Bit 6 Temperature Interlock Active
Packet P1 Byte 14 Bit 7
Bit 7 will be set if a TEC temperature interlock is active.

Baud Rate SD6BR

Status Digital 6 Baud Rate
Packet P1 Byte 16 upper half byte
Reflects a numerical value corresponding to the baud rate.

| Numerical value | baud rate |
|-----------------|-----------|
| 1 | 1200 |
| 2 | 2400 |
| 3 | 4800 |
| 4 | 9600 |
| 5 | 19200 |
| 6 | 38400 |
| 7 | 57600 |
| 8 | 115200 |

Working Hours SD6WH

Status Digital 6 Working Hours
Packet P1 Byte 17 18 19 und 20
Reflects the operating hours of the system.

Diode working Hours SD6DWH

Status Digital 6 Diode Working Hours
Packet P1 Byte 21 22 23 und 24
Reflects the diode operating hours. The counter reading can be resetted by control bit CB5RD H.

Revision Number SD6REV

Status Digital 6 Revision Number of firmware
Packet P2 Byte 8 upper half byte first digit is SD6REV1
Packet P2 Byte 10 upper half byte second digit is SD6REV2
Packet P2 Byte 12 upper half byte third digit is SD6REV3
Packet P2 Byte 14 upper half byte fourth digit is SD6REV4
For the half bytes only values of 0 to 9 are permitted.

**RS 232 Port
Software Protocol**

The revision number of the firmware results of
SD6REV SD6REV4 + SD6REV3 + SD6REV2 + SD6REV1
Example for a revision number 0109

Last Fault SD6LF

Status Digital 6 Last Fault
Packet P2 Byte 16 upper half byte
Reflects the error number of the last fault.

| Error number | Error |
|--------------|------------------------------------|
| 1 | Temperature interlock |
| 2 | Decoder error |
| 3 | Communication error |
| 4 | RS232 port data fail |
| 5 | RS232 port wrong sign |
| 6 | Hardware fail |
| 7 | Voltage supervision value exceeded |

Serial number SD6SN

Status Digital 6 Serial Number
Packet P3 Byte 7 and 8
Reflects the serial number of the system.

Time Out RS 232 port SD4TOUT

Status Digital 4 Time Out RS232 Port
Packet P3 Byte 9 and 10
Reflects the Time Out value of the RS 232 port.
The Time Out value is determined by the configuration word CFT5TOUT the value is stored in the memory.

Time Out Temperature Control SD4TOTC

Status Digital 4 Time Out Temperature Control
Packet P3 Byte 21 and 22
Reflects the Time Out value of the temperature control.
The Time Out value is determined by the configuration word CFT5TOTC the value is stored in the memory.

Diode Current Set Point Limited SA1DCSPL

Status Analog 1 Diode Current Set Point Limited
Packet P1 Byte 7 and lower half byte of byte 8
Reflects the actual diode current set point limited by the diode current limit value. The diode current limit value may be the CA-DCL signal of the control port the value of the nonvolatile memory setup software or the setting of the diode current limit potentiometer at the DT 400.

**RS 232 Port
Software Protocol****Diode Current Actual SA1DCACT**

Status Analog 1 Diode Current Actual
Packet P1 Byte 9 and lower half byte of byte10
Reflects the actual diode current.

Diode Voltage Actual SA1DVACT

Status Analog 1 Diode Voltage Actual
Packet P1 Byte 11 and lower half byte of byte12
Reflects the actual diode voltage.

Diode Current Set Point 2 SA3DCSP2

Status Analog 3 Diode Current Set Point 2
Packet P1 Byte 13 and lower half byte of byte14
Reflects the diode current modulation signal of the BNC jack at the rear panel.
Not implemented.

TEC Temperature Actual SA1PTACT

Status Analog 1 Peltier Temperature Actual
Packet P1 Byte 15 and lower half byte of byte16
Reflects the actual TEC temperature.

Diode Current Limit SA2DCL

Status Analog 2 Diode Current Limit
Packet P2 Byte 7 and lower half byte of byte 8
Reflects the diode current limit signal CA-DCL at the control port.

Diode Current Set Point SA2DCSP

Status Analog 2 Diode Current Set Point
Packet P2 Byte 11 and lower half byte of byte 12
Reflects the diode current set point signal CA-DCSP at the control port.

TEC Temperature Set Point SA2PTSP

Status Analog 2 Peltier Temperature Set Point
Packet P2 Byte 17 and lower half byte of byte 18
Reflects the Peltier temperature set point signal CA-PTSP at the control port.

Diode Current Set Point SA3DCSP

Status Analog 3 Diode Current Set Point Control Panel
Packet P2 Byte 13 and lower half byte of byte 14
Reflects the diode current set point of the control panel.

TEC Temperature Set Point SA3PTSP

Status Analog 3 Peltier Temperature Set Point Control Panel
Packet P2 Byte 19 and lower half byte of byte 20
Reflects the Peltier temperature set point of the control panel.

**RS 232 Port
Software Protocol****Diode Current Set Point SD4DCSP**

Status Digital 4 Diode Current Set Point Memory
Packet P2 Byte 15 and lower half byte of byte 16
Packet P3 Byte 11 and lower half byte of byte 12
Reflects the diode current set point stored in the memory.

Diode Current Limit SD4DCL

Status Digital 4 Diode Current Limit Memory
Packet P2 Byte 9 and lower half byte of byte 10
Packet P3 Byte 13 and lower half byte of byte 14
Reflects the diode current limit stored in the memory.

TEC Temperature Set Point SD4PTSP

Status Digital 4 Peltier Temperature Set Point Memory
Packet P2 Byte 21 and lower half byte of byte 22
Packet P3 Byte 15 and lower half byte of byte 16
Reflects the Peltier temperature set point stored in the memory.

TEC Temperature Interlock CD4PTL

Control Digital 4 Peltier Temperature Interlock
Packet P3 Byte 17 and lower half byte of byte 18
Reflects the Peltier temperature interlock value stored in the memory.

Diode Voltage Limit CD4DVL

Control Digital 4 Diode Voltage Limit Memory
Packet P3 Byte 19 and lower half byte of byte 20
Reflects the diode voltage limit value stored in the memory.

RS 232 Port Software Protocol

Transmitted data

Independently of configuration, operating mode and interface, status data will be transmitted cyclically at the RS 232 port. For a better data management, the status data are packed into 3 data packets. Each of these packets consists of 26 bytes.

Packet P1 contains measurements, current operating states and operating hours.

Packet P2 contains data of the control port and data of the control panel.

Packet P3 contains data stored in the memory.

The separation of data packets offers the possibility for transmitting only packets whose contents have changed, resulting in a shorter cycle time.

The basic version however does not have this feature.

A packet consists of

| | |
|-------------------|---------|
| Start of data set | 2 Byte |
| Status data bytes | 22 Byte |
| End of data set | 2 Byte |

Status data packet overview

| | Packet P1 | Packet P2 | Packet P3 |
|---------|---------------------|------------|------------|
| Byte 1 | Start byte | Start byte | Start byte |
| Byte 2 | Start byte | Start byte | Start byte |
| Byte 3 | SD6CON | SD6CON | SD6CON |
| Byte 4 | SD6OM | SD6OM | SD6OM |
| Byte 5 | SD6DEC | SD6DEC | SD6DEC |
| Byte 6 | SD6IOC | SD6IOC | SD6IOC |
| Byte 7 | SA1DCSPL | SA2DCL | SD6SN |
| Byte 8 | Error Bits | SD6REV1 | SD6SN |
| Byte 9 | SA1DCACT | SD4DCL | SD4TOUT |
| Byte 10 | Error Bits | SD6REV2 | |
| Byte 11 | SA1DVACT | SA2DCSP | SD4DCSP |
| Byte 12 | Operating mode bits | SD6REV3 | |
| Byte 13 | SA3DCSP2 | SA3DCSP | SD4DCL |
| Byte 14 | Operating mode bits | | SD6REV4 |
| Byte 15 | SA1PTACT | SD4DCSP | SD4PTSP |

| Byte 20 | SD6 H | | |
| Byte 21 | SD6D H | SD4PTSP | SD4TOTC |
| Byte 22 | SD6D H | | |
| Byte 23 | SD6D H | SD4DECREM | SD4DECLOC |
| Byte 24 | SD6D H | SD4IOCREM | SD4IOCLOC |
| Byte 25 | Stop byte | Stop byte | Stop byte |
| Byte 26 | Stop byte | Stop byte | Stop byte |

**RS 232 Port
Software Protocol**

Description packet P1

Packet P1 contains measurements current operating states and operating hours.

Packet P1 status byte 1 start byte

Packet P1 status byte 2 start byte

For starting the sequence a start byte will be send twice.

The start byte must have a hexadecimal value of 0A or a binary value of 0000 1010 .

Packet P1 status byte 3 control byte SD6CON

8 bit word binary output reflects the current operating state.

| | | |
|-------|-------------|--|
| Bit 0 | | Unused. |
| Bit 1 | 1 SB6RD H | Counter for diode operating hours is resetted. |
| Bit 2 | 1 SB6PSON | System is in on-state. |
| Bit 3 | | Unused. |
| Bit 4 | 1 SB6TSD | TEC shut down is active. |
| Bit 5 | 1 SB6REBOOT | System reboot was triggered. |
| Bit 6 | 1 SB6STORE | Data are saved. |
| Bit 7 | 1 SB6CPPSON | System is turned on by CD-DCON-signal at the control port. |

Packet P1 status byte 4 operating state byte SD6OM

8 bit word binary output reflects the current operating mode.

| | | |
|-------|-----------|------------------------------------|
| Bit 0 | | Unused. |
| Bit 1 | 1 SB6OMRS | RS232 port is used for control. |
| Bit 2 | | Unused. |
| Bit 3 | 1 SB6REM | Remote mode is active. |
| Bit 4 | 1 SB6TSDA | TEC shut down is active. |
| Bit 5 | | Unused. |
| Bit 6 | 1 SB6RRS | Data were received of RS 232 port. |
| Bit 7 | | Unused. |

Packet P1 status byte 5 data source decoder SD6DEC

8 bit word binary output reflects the data source assignments.

| | | |
|-------|-------|---|
| Bit 1 | Bit 0 | |
| 0 | 0 | The diode current limit value is given by RS 232 port. |
| 0 | 1 | The diode current limit value is given by memory. |
| 1 | 0 | The diode current limit value is given by control port. |

| | | | |
|-------|-------|-------|--|
| Bit 4 | Bit 3 | Bit 2 | |
| 0 | 0 | 0 | The diode current set point is given by RS 232 port. |
| 0 | 0 | 1 | The diode current set point is given by memory. |
| 0 | 1 | 0 | The diode current set point is given control port. |
| 1 | 0 | 0 | The diode current set point is given by control panel. |

**RS 232 Port
Software Protocol**

| | | | |
|-------|-------|-------|--|
| Bit 7 | Bit 6 | Bit 5 | |
| 0 | 0 | 0 | The TEC temperature set point is given by RS 232 port. |
| 0 | 0 | 1 | The TEC temperature set point is given by memory. |
| 0 | 1 | 0 | The TEC temperature set point is given by control port. |
| 1 | 0 | 0 | The TEC temperature set point is given by control panel. |

Other settings lead to a decoder fault error bit EB6DECF will be set.

Packet P1 status byte 6 in out control SD6IOC

8 bit word binary output reflects the settings of the status bits and defines the packet assignments with bit 6 and bit 7.

| | | | |
|-------|---|-----------|--|
| Bit 0 | 1 | SB6CPSDE | Shut down signal of control port approved. |
| Bit 1 | | | Unused. |
| Bit 2 | 1 | SB6SDPOLP | Shut down signal polarity is positive. |
| Bit 3 | 1 | SB6TCON | Temperature interlock control is active. |
| Bit 4 | | | Unused. |
| Bit 5 | | | Unused. |
| Bit 6 | 0 | | Must be 0. |
| Bit 7 | 0 | | Must be 0. |

Packet P1 status byte 7 diode current set point limited SA1DCSPL

Packet P1 status byte 8 Error bits

SA1DCSPL 1 1 1 1 1 1 1 1 1 1 1 1

12 bit value resolution 4095 steps range 0 to 50 A for LS 400-50 increment 12 21 mA
range 0 to 60 A for LS 400-60 increment 14 65 mA.

Reflects the actual diode current set point limited by a diode current limit value. A diode current limit value may be the CA-DCL signal of the control port the value of the nonvolatile memory setup software or the setting of the diode current limit potentiometer at the DT 400.

The lower half byte of status byte 8 is the high-order part of the 12 bit value.

Error bits 1 1 1 1

4 bit value reflects faults.

The upper error bits.

| | | |
|-------|----------|---|
| Bit 4 | EB6TL | Error bit temperature error. |
| Bit 5 | EB6DFAIL | Error bit RS 232 port data fail. |
| Bit 6 | EB6TOUT | Error bit RS 232 port time out. |
| Bit 7 | EB6 S | Error bit RS 232 port wrong character received. |

Packet P1 status byte 9 diode current actual SA1DCACT

Packet P1 status byte 10 Error bits

SA1DCACT 1 1 1 1 1 1 1 1 1 1 1 1

12 bit value resolution 4095 steps range 0 to 50 A for LS 400-50 increment 12 21 mA
range 0 to 60 A for LS 400-60 increment 14 65 mA.

Reflects the actual diode current.

**RS 232 Port
Software Protocol**

The lower half byte of status byte 10 is the high-order part of the 12 bit value.

Error bits 1 1 1 1

4 bit value reflects faults.

The upper half byte of status byte 10 contains the following error bits.

| | | |
|-------|----------|---|
| Bit 4 | EB6HFAIL | Error bit hardware. |
| Bit 5 | | Unused. |
| Bit 6 | EB6VL | Error bit diode voltage limit exceeded. |
| Bit 7 | EB6DECF | Error bit data source decoder error. |

Packet P1 status byte 11 diode voltage SA1DVACT

Packet P1 status byte 12 operating state bits

SA1DVACT 1 1 1 1 1 1 1 1 1 1 1 1

12 bit value resolution 4095 steps range 0 to 25 V increment 6 10501 mV.

Reflects the diode voltage.

The lower half byte of status byte 12 is the high-order part of the 12 bit value.

Operating state bits 1 1 1 1

4 bit value reflects operating states.

The upper half byte of status byte 12 contains the following operating state bits.

| | | |
|-------|----------|--------------------------|
| Bit 4 | SB6PTL | TEC temperature is low. |
| Bit 5 | SB6PTH | TEC temperature is high. |
| Bit 6 | SB6SDA | Shut down is active. |
| Bit 7 | SB6PSONA | System is in on-state. |

Packet P1 status byte 13 Current Set Point SA3DCSP2

Packet P1 status byte 14 Operating State bits

SA3DCSP2 1 1 1 1 1 1 1 1 1 1 1 1

12 bit value resolution 4095 steps range 0 to 50 A for LS 400-50 increment 12 21 mA

range 0 to 60 A for LS 400-60 increment 14 65 mA.

Reflects the diode current set point signal at X3 of a control panel.

The lower half byte of status byte 14 is the high-order part of the 12 bit value.

Not implemented.

Operating state bits 1 1 1 1

4 bit value reflects operating states.

The upper half byte of status byte 14 contains the following operating states bits.

| | | |
|-------|----------|--------------------------------------|
| Bit 4 | SB6PSR | Control interface is ready. |
| Bit 5 | SB6ILA | Safety interlock is active. |
| Bit 6 | SB6LOCAL | Local mode is active. |
| Bit 7 | SB6TILA | TEC temperature interlock is active. |

**RS 232 Port
Software Protocol**

Packet P1 status byte 15 TEC Temperature Actual SA1PTACT

Packet P1 status byte 16 Baud rate SD6BR

SA1PTACT 1 1 1 1 1 1 1 1 1 1 1 1

12 bit value resolution 4095 steps range 0 to 50 C increment 0 01221 C.

Reflect the actual TEC temperature.

The lower half byte of status byte 16 is the high-order part of the 12 bit value.

Baud rate 1 1 1 1

4 bit value binary output range 0 bis 15 reflects the defined baud rate.

The upper half byte of status byte 16 contains the following baud rates.

| Number | Baud rate |
|--------|-----------|
| 1 | 1200 |
| 2 | 2400 |
| 3 | 4800 |
| 4 | 9600 |
| 5 | 19200 |
| 6 | 38400 |
| 7 | 57600 |
| 8 | 115200 |

Packet P1 status byte 17 Counter Operating Hours SD6WH

Packet P1 status byte 18

Packet P1 status byte 19

Packet P1 status byte 20

32 bit value resolution 4294967295 steps increment 1 second.

Reflects the operating time of the system.

Operating time in seconds $P1SB20_{de} \cdot 256^3 + P1SB19_{de} \cdot 256^2 + P1SB18_{de} \cdot 256 + P1SB17_{de}$

Packet P1 status byte 21 Counter Operating Hours SD6DWH

Packet P1 status byte 22

Packet P1 status byte 23

Packet P1 status byte 24

32 bit value resolution 4294967295 steps increment 1 second.

Reflects the operating time of the diodes.

Operating time in seconds $P1SB24_{de} \cdot 256^3 + P1SB23_{de} \cdot 256^2 + P1SB22_{de} \cdot 256 + P1SB21_{de}$

Packet P1 status byte 25 Stop byte

Packet P1 status byte 26 Stop byte

For the end of the sequence a stop byte will be send twice.

The stop byte must have a hexadecimal value of 0B or a binary value of 0000 1011 .

**RS 232 Port
Software Protocol**

Description of Packet P2

Packet P2 reflects data from control port and from control panel.

Packet P2 status byte 1 Start byte
Packet P2 status byte 2 Start byte

For starting the sequence a start byte will be send twice.

The start byte must have a hexadecimal value of 0A or a binary value of 0000 1010 .

Packet P2 status byte 3 Control byte SD6CON

8 bit word binary output reflects the current operating state.

| | | |
|-------|---|---|
| Bit 0 | | Unused. |
| Bit 1 | 1 | SB6RD H Counter for diode operating hours is reset. |
| Bit 2 | 1 | SB6PSON System is in on-state. |
| Bit 3 | | Unused. |
| Bit 4 | 1 | SB6TSD TEC shut down is active. |
| Bit 5 | 1 | SB6REBOOT System reboot was triggered. |
| Bit 6 | 1 | SB6STORE Data are saved. |
| Bit 7 | 1 | SB6CPPSON System is turned on by CD-DCON-signal at the control port. |

Packet P2 status byte 4 operating state byte SD6OM

8 bit word binary output reflects the current operating mode.

| | | |
|-------|---|--|
| Bit 0 | | Unused. |
| Bit 1 | 1 | SB6OMRS RS232 port is used for control. |
| Bit 2 | | Unused. |
| Bit 3 | 1 | SB6REM Remote mode is active. |
| Bit 4 | 1 | SB6TSDA TEC shut down is active. |
| Bit 5 | | Unused. |
| Bit 6 | 1 | SB6RRS Data were received at RS 232 port. |
| Bit 7 | | Unused. |

Packet P2 status byte 5 data source decoder SD6DEC

8 bit word binary output reflects the data source assignments.

| | | |
|-------|-------|---|
| Bit 1 | Bit 0 | |
| 0 | 0 | The diode current limit value is given by RS 232 port. |
| 0 | 1 | The diode current limit value is given by memory. |
| 1 | 0 | The diode current limit value is given by control port. |

| | | | |
|-------|-------|-------|--|
| Bit 4 | Bit 3 | Bit 2 | |
| 0 | 0 | 0 | The diode current set point is given by RS 232 port. |
| 0 | 0 | 1 | The diode current set point is given by memory. |
| 0 | 1 | 0 | The diode current set point is given by control port. |
| 1 | 0 | 0 | The diode current set point is given by control panel. |

**RS 232 Port
Software Protocol**

| | | | |
|-------|-------|-------|--|
| Bit 7 | Bit 6 | Bit 5 | |
| 0 | 0 | 0 | The TEC temperature set point is given by RS 232 port. |
| 0 | 0 | 1 | The TEC temperature set point is given by memory. |
| 0 | 1 | 0 | The TEC temperature set point is given by control port. |
| 1 | 0 | 0 | The TEC temperature set point is given by control panel. |

Different settings lead to a decoder fault error bit EB6DECF will be set.

Packet P2 status byte 6 in out control SD6IOC

8 bit word binary output reflects the settings of the status bits and defines the packet assignments with bit 6 and bit 7.

| | | | |
|-------|---|-----------|--|
| Bit 0 | 1 | SB6CPSDE | Shut down signal of control port approved. |
| Bit 1 | | | Unused. |
| Bit 2 | 1 | SB6SDPOLP | Shut down signal polarity is positive. |
| Bit 3 | 1 | SB6TCON | Temperature interlock control is active. |
| Bit 4 | | | Unused. |
| Bit 5 | | | Unused. |
| Bit 6 | 1 | | Must be 1. |
| Bit 7 | 0 | | Must be 0. |

Packet P2 status byte 7 Diode Current Limit SA2DCL

Packet P2 status byte 8 Revision number of firmware, first digit SD6REV1

SA2DCL 1 1 1 1 1 1 1 1 1 1 1 1

12 bit value resolution 4095 steps range 0 to 50 A for LS 400-50 increment 12.21 mA
range 0 to 60 A for LS 400-60 increment 14.65 mA.

Reflects the diode current limit value CA-DCL at the control port.

The lower half byte of status byte 8 is the high-order part of the 12 bit value.

SD6REV1 1 0 0 1

4 bit value range 0 to 9.

Reflects the first digit of the revision number of the control interface firmware.

The revision number of the firmware results of

SD6REV SD6REV4 + SD6REV3 + SD6REV2 + SD6REV1

The upper half byte of status byte 8 is the least significant digit of the revision number.

Example for a revision number 01.09

Packet P2 status byte 9 Diode Current Limit SD4DCL

Packet P2 status byte 10 Revision number of firmware, second digit SD6REV2

SD4DCL 1 1 1 1 1 1 1 1 1 1 1 1

12 bit value resolution 4095 steps range 0 to 50 A for LS 400-50 increment 12.21 mA
range 0 to 60 A for LS 400-60 increment 14.65 mA.

Reflects the diode current limit value from the memory.

The lower half byte of status byte 10 is the high-order part of the 12 bit value.

**RS 232 Port
Software Protocol**

SD6REV2 0 0 0 0

4 bit value range 0 to 9.

Reflects the second digit of the revision number of the control interface firmware.

The revision number of the firmware results of

SD6REV SD6REV4 + SD6REV3 + SD6REV2 + SD6REV1

The upper half byte of status byte 10 is the most significant digit after the dot.

E ample for a revision number 01.09

Packet P2 status byte 11 Diode Current Set Point SD2DCSP

Packet P2 status byte 12 Revision number of firmware, third digit SD6REV3

SD2DCSP 1 1 1 1 1 1 1 1 1 1 1 1

12 bit value resolution 4095 steps range 0 to 50 A for LS 400-50 increment 12 21 mA

range 0 to 60 A for LS 400-60 increment 14 65 mA.

Reflects the diode current set point CA-DCSP at the control port.

The lower half byte of status byte 12 is the high-order part of the 12 bit value.

SD6REV3 0 0 0 1

4 bit value range 0 to 9.

Reflects the third digit of the revision number of the control interface firmware.

The revision number of the firmware results of

SD6REV SD6REV4 + SD6REV3 + SD6REV2 + SD6REV1

The upper half byte of status byte 12 is the least significant digit left of the dot.

E ample for a revision number 01.09

Packet P2 status byte 13 Diode Current Set Point SA3DCSP

Packet P2 status byte 14 Revision number of firmware, fourth digit SD6REV4

SA3DCSP 1 1 1 1 1 1 1 1 1 1 1 1

12 bit value resolution 4095 steps range 0 to 50 A for LS 400-50 increment 12 21 mA

range 0 to 60 A for LS 400-60 increment 14 65 mA.

Reflects the diode current set point at the control panel.

The lower half byte of status byte 14 is the high-order part of the 12 bit value.

SD6REV4 0 0 0 0

4 bit value range 0 to 9.

Reflects the fourth digit of the revision number of the control interface firmware.

The revision number of the firmware results of

SD6REV SD6REV4 + SD6REV3 + SD6REV2 + SD6REV1

The upper half byte of status byte 14 is the most significant digit left of the dot.

E ample for a revision number 01.09

Packet P2 status byte 15 Diode Current Set Point in memory SD4DCSP

Packet P2 status byte 16 Number of last faults SD6LF

SD4DCSP 1 1 1 1 1 1 1 1 1 1 1 1

12 bit value resolution 4095 steps range 0 to 50 A for LS 400-50 increment 12 21 mA

range 0 to 60 A for LS 400-60 increment 14 65 mA.

Reflects the diode current set point of the memory.

The lower half byte of status byte 16 is the high-order part of the 12 bit value.

**RS 232 Port
Software Protocol**

SD6LF 1 1 1 1

4 bit value range 0 to 15.

The upper half byte of status byte 16 contains the number of the last faults.

| Fault number | Fault name |
|--------------|---------------------------------------|
| 1 | TEC temperature fault. |
| 2 | Decoder error. |
| 3 | Communication error. |
| 4 | RS 232 port data fail. |
| 5 | RS 232 port wrong character received. |
| 6 | Hardware fail. |
| 7 | Diode voltage limit exceeded. |

Packet P2 status byte 17 TEC Temperature Set Point SA2PTSP

Packet P2 status byte 18

SA2PTSP 1 1 1 1 1 1 1 1 1 1 1 1

12 bit value resolution 4095 steps range 0 to 50 C increment 0.01221 C.

Reflects the TEC temperature set point CA-PTSP at the control port.

The lower half byte of status byte 18 is the high-order part of the 12 bit value.

The high-order half byte of status byte 18 is unused.

Packet P2 status byte 19 TEC Temperature Set Point SA3PTSP

Packet P2 status byte 20

SA3PTSP 1 1 1 1 1 1 1 1 1 1 1 1

12 bit value resolution 4095 steps range 0 to 50 C increment 0.01221 C.

Reflects the TEC temperature set point of the control panel.

The lower half byte of status byte 20 is the high-order part of the 12 bit value.

The high-order half byte of status byte 20 is unused.

Packet P2 status byte 21 TEC Temperature Set Point SD4PTSP

Packet P2 status byte 22

SD4PTSP 1 1 1 1 1 1 1 1 1 1 1 1

12 bit value resolution 4095 steps range 0 to 50 C increment 0.01221 C.

Reflects the TEC temperature set point stored in the memory.

The lower half byte of status byte 22 is the high-order part of the 12 bit value.

The high-order half byte of status byte 22 is unused.

Packet P2 status byte 23 Data Source Decoder Remote SD4DECREM

8 bit word binary output reflects the data source assignments for the remote mode.

Bit 1 Bit 0

| | | |
|---|---|---|
| 0 | 0 | The diode current limit value is given by RS 232 port. |
| 0 | 1 | The diode current limit value is given by memory. |
| 1 | 0 | The diode current limit value is given by control port. |

**RS 232 Port
Software Protocol**

Packet P2 status byte 23 Data Source Decoder Remote SD4DECREM

| | | | |
|-------|-------|-------|--|
| Bit 4 | Bit 3 | Bit 2 | |
| 0 | 0 | 0 | The diode current set point is given by RS 232 port. |
| 0 | 0 | 1 | The diode current set point is given by memory. |
| 0 | 1 | 0 | The diode current set point is given by control port. |
| 1 | 0 | 0 | The diode current set point is given by control panel. |
| | | | |
| Bit 7 | Bit 6 | Bit 5 | |
| 0 | 0 | 0 | The TEC temperature set point is given by RS 232 port. |
| 0 | 0 | 1 | The TEC temperature set point is given by memory. |
| 0 | 1 | 0 | The TEC temperature set point is given by control port. |
| 1 | 0 | 0 | The TEC temperature set point is given by control panel. |

Different settings lead to a decoder fault error bit EB6DECF will be set.

Packet P2 status byte 24 In Out Control Remote SD4IOCREM

8 bit value binary output reflects assignments for the remote mode.

| | | | |
|-------|---|-----------|--|
| Bit 0 | 1 | SB4SDCPER | Shut Down signal of control port approved. |
| Bit 1 | | | Unused |
| Bit 2 | X | | Irrelevant. |
| Bit 3 | X | | Irrelevant. |
| Bit 4 | X | | Irrelevant. |
| Bit 5 | X | | Irrelevant. |
| Bit 6 | X | | Irrelevant. |
| Bit 7 | X | | Irrelevant. |

Packet P2 status byte 25 Stop byte

Packet P2 status byte 26 Stop byte

For the end of the sequence a stop byte will be send twice.

The stop byte must have a hexadecimal value of 0B or a binary value of 0000 1011 .

Description of the packet P3

The packet P3 contains the data stored in the memory of the control interface.

Packet P3 status byte 1 Start byte

Packet P3 status byte 2 Start byte

For starting the sequence a start byte will be send twice.

The start byte must have a hexadecimal value of 0A or a binary value of 0000 1010 .

**RS 232 Port
Software Protocol**

Packet P3 status byte 3 Control Byte SD6CON

8 bit word binary output reflects the operating state.

| | | |
|-------|-------------|--|
| Bit 0 | | Unused. |
| Bit 1 | 1 SB6RD H | Counter for diode operating hours is resetted. |
| Bit 2 | 1 SB6PSON | System is in on-state. |
| Bit 3 | | Unused. |
| Bit 4 | 1 SB6TSD | TEC shut down is active. |
| Bit 5 | 1 SB6REBOOT | System reboot was triggered. |
| Bit 6 | 1 SB6STORE | Data are saved. |
| Bit 7 | 1 SB6CPPSON | System is turned on by CD-DCON-signal at the control port. |

Packet P4 status byte 4 Operating State Byte SD6OM

8 bit word binary output reflects the current operating mode.

| | | |
|-------|-----------|------------------------------------|
| Bit 0 | | Unused. |
| Bit 1 | 1 SB6OMRS | RS232 port is used for control. |
| Bit 2 | | Unused. |
| Bit 3 | 1 SB6REM | Remote mode is active. |
| Bit 4 | 1 SB6TSDA | TEC shut down is active. |
| Bit 5 | | Unused. |
| Bit 6 | 1 SB6RRS | Data were received at RS 232 port. |
| Bit 7 | | Unused. |

Packet P3 status byte 5 Data Source Decoder SD6DEC

8 bit word binary output reflects the data source assignments.

| | | | |
|-------|-------|---|--|
| Bit 1 | Bit 0 | | |
| 0 | 0 | The diode current limit value is given by RS 232 port. | |
| 0 | 1 | The diode current limit value is given by memory. | |
| 1 | 0 | The diode current limit value is given by control port. | |
| Bit 4 | Bit 3 | Bit 2 | |
| 0 | 0 | 0 | The diode current set point is given by RS 232 port. |
| 0 | 0 | 1 | The diode current set point is given by memory. |
| 0 | 1 | 0 | The diode current set point is given by control port. |
| 1 | 0 | 0 | The diode current set point is given by control panel. |
| Bit 7 | Bit 6 | Bit 5 | |
| 0 | 0 | 0 | The TEC temperature set point is given by RS 232 port. |
| 0 | 0 | 1 | The TEC temperature set point is given by memory. |
| 0 | 1 | 0 | The TEC temperature set point is given by control port. |
| 1 | 0 | 0 | The TEC temperature set point is given by control panel. |

Different settings lead to a decoder fault error bit EB6DECF will be set.

**RS 232 Port
Software Protocol**

Packet P3 status byte 23 Data Source Decoder Local SD6DECLOC

| | | | |
|-------|-------|-------|--|
| Bit 7 | Bit 6 | Bit 5 | |
| 0 | 0 | 0 | The TEC temperature set point is given by RS 232 port. |
| 0 | 0 | 1 | The TEC temperature set point is given by memory. |
| 0 | 1 | 0 | The TEC temperature set point is given by control port. |
| 1 | 0 | 0 | The TEC temperature set point is given by control panel. |

Different settings lead to a decoder fault error bit EB6DECF will be set.

Packet P2 status byte 24 In Out Control Remote SD4IOCLOC

8 bit value binary output reflects assignments for the local mode.

| | | | |
|-------|---|-----------|--|
| Bit 0 | 1 | SB4SDCPER | Shut Down signal of control port approved. |
| Bit 1 | | | Unused |
| Bit 2 | | | Unused. |
| Bit 3 | | | Unused. |
| Bit 4 | | | Unused. |
| Bit 5 | | | Unused. |
| Bit 6 | | | Unused. |
| Bit 7 | | | Unused. |

Packet P3 status byte 25 Stop byte

Packet P3 status byte 26 Stop byte

For the end of the sequence a stop byte will be send twice.

The stop byte must have a hexadecimal value of 0B or a binary value of 0000 1011 .

**RS 232 Port
Software Protocol**

Received data

The system will be controlled by the control data set.

For safety reasons a connection supervision is implemented.

If the control interface doesn't receive data within a specific time error bit EB6TOUT is set and the diode current is turned off.

For the connection supervision it is sufficient to generate the required data traffic by using a short control data set instead of the normal control data set. The short data set can be used if the fully functional range is not required.

For configuring the control interface the configuration data set is used.

Overview

| | Control data set | Short control data set | Configuration data set |
|---------|-----------------------------|-----------------------------------|-----------------------------------|
| Byte 1 | Start byte | Start byte | Start byte |
| Byte 2 | Start byte | Start byte | Start byte |
| Byte 3 | CD5CON | CD5CON | CD5CON |
| Byte 4 | SD6OM | SD6OM | SD6COM |
| Byte 5 | CD5DEC | CD5DEC | CD5DEC |
| Byte 6 | CD5IOC | CD5IOC | CD5IOC |
| Byte 7 | CD5TOUT | Stop byte | CF5TOTC |
| Byte 8 | | Stop byte | |
| Byte 9 | CD5DCL | | CF5DCSP |
| Byte 10 | | | |
| Byte 11 | CD5DCSP | | CF5DCL |
| Byte 12 | | | |
| Byte 13 | CD5PTSP | | CF5PTSP |
| Byte 14 | | | |
| Byte 15 | Stop byte | | CF5PTL |
| Byte 16 | Stop byte | | |
| Byte 17 | | | CF5DVL |
| Byte 18 | | | |
| Byte 19 | | | CF5DECLOC |
| Byte 20 | | | CF5IOCLOC |
| Byte 21 | | | CF5DECREM |
| Byte 22 | | | CF5IOCREM |
| Byte 23 | | | Stop byte |
| Byte 24 | | | Stop byte |

**RS 232 Port
Software Protocol**

Control data set

A control data set consists of

| | |
|-------------------|---------|
| Start of data set | 2 byte |
| Control data | 12 byte |
| End of data set | 2 byte |

Byte 1 Start byte
Byte 2 Start byte

For starting the sequence a start byte must be send twice.

The start byte must have a hexadecimal value of 0A or a binary value of 0000 1010 .

Byte 3 Control Byte CD5CON

8 bit word binary input.

| | | |
|-------|----------------|---|
| Bit 0 | | Unused. |
| Bit 1 | 1 CB5RD H | Resets the counter for the diode operating hours. |
| Bit 2 | 1 CB5PSON | Turns the system on. |
| Bit 3 | | Unused. |
| Bit 4 | 1 CB5TSD | Activates TEC shut down. |
| Bit 5 | 1 CB5REBOOT | Reboots system. |
| Bit 6 | 0 CB5STORE | Must be 0. |
| Bit 7 | 1 SB6CPPSON | Unused. |

Byte 4 Operating State SD6OM

8 bit word binary input unused.

Byte 5 Data Source Decoder CD5DEC

8 bit word binary input defines the data source assignments for the RS 232 mode.

| | | |
|-------|-------|---|
| Bit 1 | Bit 0 | |
| 0 | 0 | The diode current limit value is given by RS 232 port. |
| 0 | 1 | The diode current limit value is given by memory. |
| 1 | 0 | The diode current limit value is given by control port. |

| | | | |
|-------|-------|-------|--|
| Bit 4 | Bit 3 | Bit 2 | |
| 0 | 0 | 0 | The diode current set point is given by RS 232 port. |
| 0 | 0 | 1 | The diode current set point is given by memory. |
| 0 | 1 | 0 | The diode current set point is given by control port. |
| 1 | 0 | 0 | The diode current set point is given by control panel. |

| | | | |
|-------|-------|-------|--|
| Bit 7 | Bit 6 | Bit 5 | |
| 0 | 0 | 0 | The TEC temperature set point is given by RS 232 port. |
| 0 | 0 | 1 | The TEC temperature set point is given by memory. |
| 0 | 1 | 0 | The TEC temperature set point is given by control port. |
| 1 | 0 | 0 | The TEC temperature set point is given by control panel. |

Different settings lead to a decoder fault error bit EB6DECF will be set.

**RS 232 Port
Software Protocol**

Byte 6 In Out Control CD5IOC

8 bit word binary input defines settings.

| | | | |
|-------|---|----------|--|
| Bit 0 | 1 | CB5SDCPE | Enables CD-DCSD signal of Control Port for shut downing. |
| Bit 1 | | | Unused. |
| Bit 2 | | | Unused. |
| Bit 3 | | | Unused. |
| Bit 4 | 0 | | Must be 0. |
| Bit 5 | 0 | | Must be 0. |
| Bit 6 | | | Unused. |
| Bit 7 | | | Unused. |

Byte 7 Time Out RS 232 Port CD5TOUT

Byte 8

16 bit value resolution 65535 steps range 0 to 655.3 s increment 100 ms.

Defines the time which may pass till receiving the next data. An overrun leads to a time out error error bit EB6TOUT will be set and the diode current will be turned off.

The time out control is only active if control by RS 232 port is active.

Byte 8 is the high-order part of the 16 bit value.

Byte 9 Diode Current Limit CD5DCL

Byte 10

12 bit value resolution 4095 steps range 0 to 50 A for LS 400-50 increment 12.21 mA

range 0 to 60 A for LS 400-60 increment 14.65 mA.

Defines the diode current limit value for the RS 232 control mode.

The value is valid if RS 232 is selected as a data source for the diode current limit value.

Byte 11 Diode Current Set Point CD5DCSP

Byte 12

12 bit value resolution 4095 steps range 0 to 50 A for LS 400-50 increment 12.21 mA

range 0 to 60 A for LS 400-60 increment 14.65 mA.

Defines the diode current set point for the RS 232 control mode.

The value is valid if RS 232 is selected as a data source for the diode current set point.

Byte 13 TEC Temperature Set Point CD5PTSP

Byte 14

12 bit value resolution 4095 steps range 0 to 50 °C increment 0.01221 °C.

Defines the TEC temperature set point for the RS 232 control mode.

The value is valid if RS 232 is selected as a data source for the TEC temperature set point.

Byte 15 Stop byte

Byte 16 Stop byte

For the end of the sequence a stop byte must be send twice.

The stop byte must have a hexadecimal value of 0B or a binary value of 0000 1011.

**RS 232 Port
Software Protocol**

Short Control data set

A short control data set consists of
 Start of data set 2 byte
 Control data 4 byte
 End of data set 2 byte

Byte 1 Start byte
Byte 2 Start byte

For starting the sequence a start byte must be send twice.
 The start byte must have a hexadecimal value of 0A or a binary value of 0000 1010 .

Byte 3 Control Byte CD5CON

8 bit word binary input.

| | | |
|-------|----------------|---|
| Bit 0 | | Unused. |
| Bit 1 | 1 CB5RD H | Resets the counter for the diode operating hours. |
| Bit 2 | 0 CB5PSON | Turns the system on. |
| Bit 3 | | Unused. |
| Bit 4 | 1 CB5TSD | Activates TEC shut down. |
| Bit 5 | 1 CB5REBOOT | Reboots system. |
| Bit 6 | 0 CB5STORE | Must be 0. |
| Bit 7 | | Unused. |

Byte 4 Operating State SD6OM

8 bit word binary input unused.

Byte 5 Data Source Decoder CD5DEC

8 bit word binary input unused.

Byte 6 In Out Control CD5IOC

8 bit word binary input defines settings.

| | | |
|-------|---|------------|
| Bit 0 | | Unused. |
| Bit 1 | | Unused. |
| Bit 2 | | Unused. |
| Bit 3 | | Unused. |
| Bit 4 | 1 | Must be 1. |
| Bit 5 | 1 | Must be 1. |
| Bit 6 | | Unused. |
| Bit 7 | | Unused. |

Byte 7 Stop byte

Byte 8 Stop byte

For the end of the sequence a stop byte must be send twice.
 The stop byte must have a hexadecimal value of 0B or a binary value of 0000 1011 .

**RS 232 Port
Software Protocol**

Configuration Data Set

A configuration data set consists of
 Start of data set 2 byte
 Configuration data 20 byte
 End of data set 2 byte

Byte 1 Start Byte
Byte 2 Start Byte

For the opening of the sequence a start byte must be send twice.
 The start byte must have a decimal value of 0A or a binary value of 0000 1010 .

Byte 3 Control Byte CD5CON
 8 bit word binary input.

| | | |
|-------|---|-------------------------|
| Bit 0 | | Unused. |
| Bit 1 | | Unused. |
| Bit 2 | 0 | CB5PSON Must be 0. |
| Bit 3 | | Unused. |
| Bit 4 | | Unused. |
| Bit 5 | | Unused. |
| Bit 6 | 1 | CB5STORE Must be 1. |
| Bit 7 | | Unused. |

Byte 4 Operating State SD6OM
 8 bit word binary input unused.

Byte 5 Data Source Decoder CD5DEC
 8 bit word binary input unused.

Byte 6 In Out Control CD5IOC
 8 bit word binary input defines settings.

| | | |
|-------|---|------------|
| Bit 0 | | Unused. |
| Bit 1 | | Unused. |
| Bit 2 | | Unused. |
| Bit 3 | | Unused. |
| Bit 4 | 1 | Must be 1. |
| Bit 5 | 0 | Must be 0. |
| Bit 6 | | Unused. |
| Bit 7 | | Unused. |

**RS 232 Port
Software Protocol**

Byte 7 Time Out Temperature Control CF5TOTC

Byte 8
CF5TOTC 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1 1

16 bit word resolution 65535 steps range 0 to 655.3 s increment 100 ms.
Defines the time which may pass till a temperature interlock event leads to an error. An overrun leads to a time out error error bit EB6TOTC will be set and the diode current will be turned off. Status byte 22 is the high-order part of the 16 bit word.

Byte 9 Diode Current Set Point CF5DCSP

Byte 10
CF5DCSP 1 1 1 1 1 1 1 1 1 1 1 1

12 bit value resolution 4095 steps range 0 to 50 A for LS 400-50 increment 12.21 mA
range 0 to 60 A for LS 400-60 increment 14.65 mA.
Defines the diode current set point which will be stored in the memory.
The value is valid if memory is selected as a data source for the diode current set point.
The lower half byte of byte 10 is the high-order part of the 12 bit value.
The upper half byte of byte 10 is unused.

Byte 11 Diode Current Limit CF5DCL

Byte 12
CF5DCL 1 1 1 1 1 1 1 1 1 1 1 1

12 bit value resolution 4095 steps range 0 to 50 A for LS 400-50 increment 12.21 mA
range 0 to 60 A for LS 400-60 increment 14.65 mA.
Defines the diode current limit value which will be stored in the memory.
The value is valid if memory is selected as a data source for the diode current limit value.
The lower half byte of byte 12 is the high-order part of the 12 bit value.
The upper half byte of byte 12 is unused.

Byte 13 TEC Temperature Set Point CF5PTSP

Byte 14
CF5PTSP 1 1 1 1 1 1 1 1 1 1 1 1

12 bit value resolution 4095 steps range 0 to 50 C increment 0.01221 C.
Defines the TEC temperature set point which will be stored in the memory.
The value is valid if memory is selected as a data source for the TEC temperature set point.
The lower half byte of byte 14 is the high-order part of the 12 bit value.
The upper half byte of byte 14 is unused.

Byte 15 TEC Temperature Interlock Limit CF5PTL

Byte 16
CF5PTL 1 1 1 1 1 1 1 1 1 1 1 1

12 bit value resolution 4095 steps range 0 to 50 C increment 0.01221 C.
Defines the TEC temperature interlock limit value which will be stored in the memory.
The lower half byte of byte 16 is the high-order part of the 12 bit value.
The upper half byte of byte 16 is unused.

**RS 232 Port
Software Protocol**

Byte 17 Diode Voltage Limit CF5DVL

Byte 18

CF5DVL 1 1 1 1 1 1 1 1 1 1 1 1 1

12 bit value resolution 4095 steps range 0 to 25 V increment 6 105 01 mV.

Defines the diode voltage limit value which will be stored in the memory.

The lower half byte of byte 18 is the high-order part of the 12 bit value.

The upper half byte of byte 18 is unused.

Byte 19 Data Source Decoder Local Mode CF5DECLOC

8 bit word binary input defines the data source assignments for the local mode.

Bit 1 Bit 0

- 0 0 The diode current limit value is given by RS 232 port.
- 0 1 The diode current limit value is given by memory.
- 1 0 The diode current limit value is given by control port.

Bit 4 Bit 3 Bit 2

- 0 0 0 The diode current set point is given by RS 232 port.
- 0 0 1 The diode current set point is given by memory.
- 0 1 0 The diode current set point is given by control port.
- 1 0 0 The diode current set point is given by control panel.

Bit 7 Bit 6 Bit 5

- 0 0 0 The TEC temperature set point is given by RS 232 port.
- 0 0 1 The TEC temperature set point is given by memory.
- 0 1 0 The TEC temperature set point is given by control port.
- 1 0 0 The TEC temperature set point is given by control panel.

Different settings lead to a decoder fault error bit EB6DECF will be set.

Byte 20 In Out Control Local Mode CF5IOCLOC

8 bit word binary input defines settings for the local mode.

- Bit 0 1 CB6SDCPEL Shut down signal of control port approved.
- Bit 1 Unused.
- Bit 2 Unused.
- Bit 3 Unused.
- Bit 4 Unused.
- Bit 5 Unused.
- Bit 6 Unused.
- Bit 7 Unused.

**RS 232 Port
Software Protocol**

Byte 21 Data Source Decoder Remote Mode CF5DECREM

8 bit word binary input defines the data source assignments for the remote mode.

| | | | |
|-------------------|---|---|--|
| Bit 1 Bit 0 | | | |
| 0 | 0 | The diode current limit value is given by RS 232 port. | |
| 0 | 1 | The diode current limit value is given by memory. | |
| 1 | 0 | The diode current limit value is given by control port. | |
| | | | |
| Bit 4 Bit 3 Bit 2 | | | |
| 0 | 0 | 0 | The diode current set point is given by RS 232 port. |
| 0 | 0 | 1 | The diode current set point is given by memory. |
| 0 | 1 | 0 | The diode current set point is given by control port. |
| 1 | 0 | 0 | The diode current set point is given by control panel. |
| | | | |
| Bit 7 Bit 6 Bit 5 | | | |
| 0 | 0 | 0 | The TEC temperature set point is given by RS 232 port. |
| 0 | 0 | 1 | The TEC temperature set point is given by memory. |
| 0 | 1 | 0 | The TEC temperature set point is given by control port. |
| 1 | 0 | 0 | The TEC temperature set point is given by control panel. |

Different settings lead to a decoder fault error bit EB6DECF will be set.

Byte 22 In Out Control Remote Mode CF5IOCREM

8 bit word binary input defines settings for the remote mode.

| | | | |
|-------|---|-----------|--|
| Bit 0 | 1 | CB6SDCPER | Shut down signal of control port approved. |
| Bit 1 | | | Unused. |
| Bit 2 | | | Unused. |
| Bit 3 | | | Unused. |
| Bit 4 | | | Unused. |
| Bit 5 | | | Unused. |
| Bit 6 | | | Unused. |
| Bit 7 | | | Unused. |

Byte 23 Stop Byte

Byte 24 Stop Byte

For the end of the sequence a stop byte must be send twice.

The stop byte must have a hexadecimal value of 0B or a binary value of 0000 1011 .

Ordering information

| Device | Current | Identification number |
|--|----------------|--|
| LS 400-50 C manually operated | 0 ... 50 A | 10100050 potentiometer and display for current set point. |

| LS 400-50 C manually and remote operated | 0 ... 50 A | 10100057 potentiometer and display for current set point and temperature set point control port RS 232 port system software safety interlock pilot laser. |
| LS 400-50 FP C and fast pulsed manually operated | 0 ... 50 A | 10100064 potentiometer and display for current set point safety interlock pilot laser. |
| LS 400-50 FP C and fast pulsed manually operated | 0 ... 50 A | 10100065 potentiometer and display for current set point and temperature set point safety interlock pilot laser. |
| LS 400-50 FP C and fast pulsed manually and remote operated | 0 ... 50 A | 10100066 potentiometer and display for current set point control port RS 232 port system software safety interlock pilot laser. |
| LS 400-50 FP C and fast pulsed manually and remote operated | 0 ... 50 A | 10100067 potentiometer and display for current set point and temperature set point control port RS 232 port system software safety interlock pilot laser. |

**Ordering information**

| Device | Current | Identification number |
|--|----------------|--|
| LS 400-60 C manually operated | 0 ... 60 A | 10100080 potentiometer and display for current set point. |
| LS 400-60 C manually operated | 0 ... 60 A | 10100081 potentiometer and display for current set point and temperature set point. |
| LS 400-60 C manually and remote operated | 0 ... 60 A | 10100082 potentiometer and display for current set point control port RS 232 port system software. |
| LS 400-60 C manually and remote operated | 0 ... 60 A | 10100083 potentiometer and display for current set point and temperature set point control port RS 232 port system software. |
| LS 400-60 C manually operated | 0 ... 60 A | 10100084 potentiometer and display for current set point safety interlock pilot laser. |
| LS 400-60 C manually operated | 0 ... 60 A | 10100085 potentiometer and display for current set point and temperature set point safety interlock pilot laser. |
| LS 400-60 C manually and remote operated | 0 ... 60 A | 10100086 potentiometer and display for current set point control port RS 232 port system software safety interlock pilot laser. |
| LS 400-60 C manually and remote operated | 0 ... 60 A | 10100087 potentiometer and display for current set point and temperature set point control port RS 232 port system software safety interlock pilot laser. |
| LS 400-60 FP C and fast pulsed manually operated | 0 ... 60 A | 10100074 potentiometer and display for current set point safety interlock pilot laser. |
| LS 400-60 FP C and fast pulsed manually operated | 0 ... 60 A | 10100075 potentiometer and display for current set point and temperature set point safety interlock pilot laser. |
| LS 400-60 FP C and fast pulsed manually and remote operated | 0 ... 60 A | 10100076 potentiometer and display for current set point control port RS 232 port system software safety interlock pilot laser. |
| LS 400-60 FP C and fast pulsed manually and remote operated | 0 ... 60 A | 10100077 potentiometer and display for current set point and temperature set point control port RS 232 port system software safety interlock pilot laser. |

Ordering information

| Device | Identification number |
|--|------------------------------|
| Temperature Sensor | 10360254 |
| 2 pole male cable connector interlock input manufacturer Binder 99 0601 00 02 | 10884986 |
| 4 pole male cable connector shutter output manufacturer Binder 99 0609 00 04 | 10884987 |

The laser systems LS 400 are also deliverable with customer-specific serigraphy and software.
It is also possible to install the components in a customer-specific enclosure like a 19" plug-in or suchlike.

According to your requirements we also can machine the dummy plate for the fibre and the heatsink.

Please ask our support.
